

# 'True Colors': A Social Wearable That Affords Vulnerability

## Introduction

'True Colors' is a social wearable prototype designed to augment co-located social interaction of players in a LARP (live action roleplay). We designed it to enable the emergence of rich social dynamics between wearers and non-wearers.

True Colors is Y-shaped, worn around the upper body, and has a front and a back side interface to distinguish between empowering interaction made by the wearer (front), and interaction made by others (back).

To design True Colors, we followed a Research-through-Design approach, used experiential qualities and social affordances to guide our process, and co-designed with LARP designers.

13 True Colors wearables were deployed in a 3-day LARP event, attended by 109 people.

From all the functionalities and interactivity the device afforded, players gravitated towards ones that emphasized the social value of experiencing vulnerability as a prompt to encourage social interaction with others.
